

CH101 - Chemistry

Instructors: Dr. David Cheung, Prof. Paul Murphy, Dr. Luca Ronconi (Coordinator)

Module Overview and General Aims

This Module lays a broad foundation in chemistry for students who have an option of continuing to study chemistry in subsequent years. Some of these students will study chemistry to degree level and pursue careers as chemists. The Module assumes no prior knowledge of chemistry, although a significant minority of students will have a Level 5 (NFQ Level 5) qualification in chemistry.

The aim is to provide the learner with the knowledge, skills and competences associated with molecular and physico-chemical approaches to the study of matter and of chemical change. The Module is designed to develop an understanding of how chemicals function in “real world” applications and how chemistry integrates with human, social and environmental issues. Students will also develop the knowledge, skills and competences appropriate for effective and safe work in a chemistry laboratory.

Module Delivery

The Module runs over both semesters I and II (24 weeks overall, 12 in Semester I/12 in Semester II).

The theory course is delivered in 72 lectures (normally 3 one-hour lectures per week, 36 in Semester I/36 in Semester II) and 18 tutorials (normally 1 one-hour tutorial per week, 9 in Semester I/9 in Semester II). In order to improve the learning process and facilitate the effective interaction between the students and the lecturers, the same tutorial is delivered twice per week.

There are 40 hours of laboratory work split into 16 practical sessions of 2.5 hours each (1 practical per week, 8 in Semester I/8 in Semester II). To gain admittance to the laboratory students must attend the pre-practical talk held prior to the beginning of each practical session.

Learning Outcomes

On successful completion of this Module, the learner will be able to:

- LO1 predict chemical formulas of compounds using valence considerations and the knowledge of simple and complex cations and anions;
- LO2 perform mass- and mole-type calculations, to include isotopes, chemical equations and chemical analyses;
- LO3 use models of structure at the atomic/molecular level, including intermolecular forces, to explain the physical properties of matter and the properties of solutions;
- LO4 draw representations of the bonding and geometry of simple inorganic and organic molecules and ions, to include Lewis structures, resonance structures, formal charges, ionic character, and the use of Valence Shell Electron Pair Repulsion (VSEPR) theory;
- LO5 show how acid-base, redox and precipitation reactions in aqueous solutions are used for qualitative and quantitative analyses;
- LO6 solve basic quantitative problems involving chemical equilibrium and chemical kinetics, to include thermochemistry, entropy, Gibbs free energy, the direction of spontaneous change, and the effect of temperature on the rate of reactions;
- LO7 name inorganic and organic compounds according to IUPAC nomenclature;

- LO8 demonstrate familiarity with the chemistry of representative elements and their compounds, and with the structure and reactivity of the main organic functional groups;
- LO9 rationalize the properties of the elements and their compounds using basic quantum-mechanical models (including electron configuration, atomic spectra and periodic trends), and using the concepts of oxidation state and charge density;
- LO10 draw mechanisms for a range of simple organic reactions;
- LO11 relate the chemical properties of selected elements and compounds to their uses, human and social relevance, and environmental impact.

On successful completion of the associated practical work in the laboratory, the learner will be able to:

- LO12 analyze salts for the presence of common cations and anions, and simple organic substances for the presence of common functional groups;
- LO13 use appropriate laboratory techniques and equipment to synthesize, separate and purify chemical compounds;
- LO14 use titrimetry and physico-chemical techniques for quantitative analysis and to determine physico-chemical properties;
- LO15 implement safe work practices in a chemistry laboratory, to include awareness of common hazards and appropriate safety precautions;
- LO16 report to a scientifically acceptable standard on laboratory work.

Textbook and Reference Material

- J.C. Kotz, P.M. Treichel, J.R. Townsend, D.A. Treichel, *Chemistry & Chemical Reactivity*, 10th Ed., Cengage Learning, 2017
- First Year Chemistry Laboratory Manual 2018 - 2019
- Lecture notes, slides and literature papers provided in due course on Blackboard

Module Outline

Topic		Class/Laboratory time	Credits (15 overall)
<i>Semester I</i>			
Lectures	Basic concepts of chemistry, the structure of atoms and molecules	12 Lectures + 3 Tutorials	6
	Chemical reactions, stoichiometry and chemical reactivity	12 Lectures + 3 Tutorials	
	Bonding and molecular structure	12 Lectures + 3 Tutorials	
Laboratory	Introduction to the chemistry laboratory	1 Practical	1.5
	Qualitative analysis of inorganic salts	2 Practicals	
	Inorganic synthesis	1 Practical	
	Quantitative analysis	3 Practicals	
	Thermochemistry	1 Practical	
<i>Semester II</i>			
Lectures	Organic chemistry	12 Lectures + 3 Tutorials	6
	Physical chemistry	12 Lectures + 3 Tutorials	
	Inorganic chemistry	12 Lectures + 3 Tutorials	
Laboratory	Chromatography and molecular structure	1 Practical	1.5
	Identification of organic compounds	3 Practicals	
	Organic synthesis	1 Practical	
	Spectrophotometry	1 Practical	
	Kinetics	1 Practical	
	Chemical equilibrium	1 Practical	

Semester I

- Basic concepts of chemistry, the structure of atoms and molecules (Dr. Luca Ronconi)
- Syllabus and homework (J.C. Kotz *et al.*, *Chemistry & Chemical Reactivity*, 10th Ed., 2017)
- Chapter 1: Basic concepts of chemistry
 - Chapter 2: Atoms, molecules and ions
 - Chapter 6: The structure of atoms

Contents:

- Classification and properties of matter
- Elements, atoms, compounds and molecules
- Atomic number and mass number
- Isotopes and calculation of atomic masses from isotopic masses and natural abundances

- The Periodic Table
- Interpretation, prediction and drawing of formulas of ionic and molecular compounds
- Naming ionic and molecular compounds
- The concept of mole and the use of molar mass in calculations
- Derivation of chemical formulas (including empirical, molecular, structural and condensed formulas) from experimental data
- Properties of the electromagnetic radiation and the wave-particle duality
- The atomic structure, the atomic quantum numbers and their use to predict the electron configuration of atoms

➤ Chemical reactions, stoichiometry and chemical reactivity (Prof. Paul Murphy)

Syllabus and homework (J.C. Kotz *et al.*, *Chemistry & Chemical Reactivity*, 10th Ed., 2017)

- Chapter 3: Chemical reactions
- Chapter 4: Stoichiometry: quantitative information about chemical reactions
- Chapter 5: Principles of chemical reactivity: energy and chemical reactions

Contents:

- Reactants, products and stoichiometric coefficients in the chemical reactions
- Aqueous solutions and solubility
- Balancing simple chemical reactions
- Definition of acids and bases, and their behavior in aqueous solution
- The oxidation numbers and their use in oxidation-reduction (redox) reactions
- Stoichiometric calculations using balanced chemical equations
- The concept of limiting reactant and its consequences in chemical reactions
- Theoretical and actual percent yields of chemical reactions
- Definition, measurement and calculation of the concentration of chemical compounds in solution
- The transfer of energy as heat associated with changes in temperature and changes of state
- The First Law of Thermodynamics
- Definition of state functions (enthalpy, internal energy) and their relationship with chemical reactions
- Calculation of the energy evolved or required for physical changes and chemical reactions using the tables of thermodynamic data

➤ Bonding and molecular structure (Prof. Paul Murphy)

Syllabus and homework (J.C. Kotz *et al.*, *Chemistry & Chemical Reactivity*, 10th Ed., 2017)

- Chapter 8: Bonding and molecular structure
- Chapter 9: Bonding and molecular structure: orbital hybridization and Molecular Orbitals

Contents:

- Application of valence, octet rule and formal charges to draw Lewis structures of simple chemical compounds
- Selected exceptions to the octet rule (*e.g.* B₂H₆, NO, NO₂, O₂)
- Application of the expanded octet to draw Lewis structures of PCl₅, SF₄, BrF₃ and SF₆
- Definition of electronegativity and its periodic trends according to the Pauling scale
- Dipole moments and classification of bond polarity
- Derivation of the shape of molecules from Lewis structures and according to the Valence Shell Electron Pair Repulsion (VSEPR) theory
- Prediction of bond angles using the VSEPR theory

- Classification of intermolecular forces (*e.g.* hydrogen bonding and London dispersion forces) and their effects on physical properties
- Description of the hybridization model and the Valence Bond (VB) theory (including their limitations), and their practical applications to derive the molecular geometry of simple chemical compounds

Semester II

➤ Organic chemistry (Prof. Paul Murphy)

Syllabus and homework (J.C. Kotz *et al.*, *Chemistry & Chemical Reactivity*, 10th Ed., 2017)

- Chapter 23: Carbon: not just another element
- F. Aldabbagh, *First Science Organic Chemistry Manual*

Contents:

- Drawing accurately the structures of organic compounds from chemical formulas and by applying Lewis method and the VSEPR theory where appropriate
- Naming organic compounds according to IUPAC rules and nomenclature (including the concept of *cis-trans* and the *E-Z* priority rules in naming alkenes)
- The main organic functional groups (including alkanes, alkenes, alkynes, alcohols, ethers, benzene, phenols, aldehydes, ketones, carboxylic acids, esters, amines and amides) and their general reactivity
- The structural isomers of C₄H₁₀ and C₅H₁₂
- Trends in the physical properties of alkanes (including the effect of molecular weight and branching)
- Differences between water, alcohols, carboxylic acids and amines (including solubility in water)
- Curly arrow mechanisms for the following reactions: halogenation of alkanes and alkenes, hydrohalic acids + alkenes, reactions of carboxylic acids with amines or inorganic bases
- Electrophiles and nucleophiles
- Chemical bonding in organic compounds (*e.g.* alkanes, alkenes, alkynes, benzene, aldehydes, ketones, and amines) using the hybridization model (sp, sp² and sp³)
- Drawing the repeating unit of an addition polymer
- The concept of chirality
- The acidity of carboxylic acids, and the basicity of amines and aniline
- Simple redox reactions involving organic compounds and the formation of esters

➤ Physical chemistry (Dr. David Cheung)

Syllabus and homework (J.C. Kotz *et al.*, *Chemistry & Chemical Reactivity*, 10th Ed., 2017)

- Chapter 10: Gases and their properties
- Chapter 11: Intermolecular forces and liquids
- Chapter 13: Solutions and their behavior
- Chapter 15: Principles of chemical reactivity: equilibria
- Chapter 16: Principles of chemical reactivity: the chemistry of acids and bases
- Chapter 17: Principles of chemical reactivity: other aspects of aqueous equilibria
- Chapter 18: Principles of chemical reactivity: entropy and free energy
- Chapter 14: Chemical kinetics: the rates of chemical reactions

Contents:

- Role of the intermolecular forces in determining the physical state of substances (contribution to the properties of liquids, relationship with solubility, driving forces for the formation of solutions)

- Chemical equilibrium and the effect of concentration and temperature
 - Evaluation of the equilibrium constants of reactions and the concentration of reactants and products at the equilibrium
 - Application of the principles of chemical equilibrium to acid-base reactions and solubility
 - Basic of entropy and Gibbs free energy, and their contribution to the direction of spontaneous change
 - The concept of reaction rate and the effect induced by altering the temperature or adding a catalyst
- Inorganic chemistry (Dr. Luca Ronconi)

Syllabus and homework (J.C. Kotz *et al.*, *Chemistry & Chemical Reactivity*, 10th Ed., 2017)

- Chapter 7: The structure of atoms and periodic trends
- Chapter 15: Principles of chemical reactivity: equilibria
- Chapter 16: Principles of chemical reactivity: the chemistry of acids and bases
- Chapter 17: Principles of chemical reactivity: other aspects of aqueous equilibria
- Chapter 21: The chemistry of the Main Group elements

Contents:

- The periodic properties/trends of the elements
- Definition and identification of metals, non-metals and semimetals
- Chemical families of the main group elements
- Chemical and physical properties/trends of the elements belonging to the same chemical family (including the diagonal relationship and the inert pair effect)
- Chemistry of the main group elements, particularly: H, Na, K, Mg, Ca, B, Al, C, Si, N, P, O, S, F, Cl
- Bonding, composition and structure of selected compounds of the main group elements
- Practical application of the principles of stoichiometry (*e.g.* stoichiometric coefficients and calculations, reactions going to completion *vs.* reactions at the equilibrium, reactions in gaseous phase, homogeneous and heterogeneous reactions, acid-base reactions, pH, solubility, etc)
- Practical uses and implications of selected main group elements and derivatives to socially relevant general themes, and their environmental impact

Module Assessment

The Module is assessed over two Semesters as follows.

- Two formal written examinations at the end of each Semester on the theory course (worth 60% overall):
 - Paper-1 ⇒ multiple choice question (MCQ) examination at the end of Semester I (worth 30%)
 - Paper-2 ⇒ short-answer questions and problems examination at the end of Semester II (worth 30%)
- Continuous Assessment (CA, worth 40% overall):
 - mandatory attendance to laboratory sessions and pre-practical talks, and submission of a written report on the laboratory work each week (worth 30%)
 - weekly online homework on topics dealt with during lectures/tutorials and a formal open-book MCQ examination on the laboratory work at the end of Semester II (worth 10%)

Marks of laboratory reports and online homework will be available on Blackboard in due course.

Results of Paper-1 examination will be returned on Blackboard as provisional grades (**not** as percentage) as follows:

- grade A: 70-100%

- grade B: 60-69%
- grade C: 50-59%
- grade D: 40-49%
- grade E+: 35-39%
- grade E-: 30-34%
- grade F: 0-29%

Students will be communicated the aggregate mark for the Module after the correction of Paper-2 is complete.

A student will have **passed** if the mark in the CA component is at least 35% **and** the aggregate mark for the Module is at least 40%.

A student will be deemed **incomplete** if the mark in the CA component is less than 35%, and **will not** be able to progress **regardless** of the performance in the written examination(s) for the Module in the 1st sitting. In this case, the student **cannot** re-sit either, and must **re-register** for the Module the following year and **re-engage in all parts** of the Module again.

A student will have **failed** the 1st sitting where the mark in the CA component is at least 35% but the overall Module mark is less than 40%. In this case, the student must repeat the two written examinations (that is, **both** Paper-1 and Paper-2) in the 2nd sitting with a view to improving the overall Module mark, retaining the CA mark from the 1st sitting. Should the student underperform also in the 2nd sitting (that is, by obtaining an aggregate mark for the Module lower than 40%), they will have **failed** the 2nd sitting and will have to **re-register** for the Module the following year and **re-engage in all parts** of the Module again.

Written Exams

Two sample exam papers from past Paper-1 examinations can be found in the "Lecture Notes & Resources" section on Blackboard, whereas past Paper-2 examinations are available in the Exam Papers Archive (<http://library.nuigalway.ie/collections/specialcollections/exampapersarchive/>) of the James Hardiman Library. Note that, according to the School of Chemistry policy, past Paper-1 examinations and past repeat (*i.e.* 2nd sitting exam papers) Paper-2 examinations are **not** made available.

➤ **Paper-1 ⇒ MCQ examination at the end of Semester I**

The written examination of 2 h duration will be marked out of 100 and will be divided into three parts (sections A, B and C) each containing 15 MCQs (45 MCQs overall). Students are required to answer **all** MCQs.

Questions will be allocated to the three sections as follows:

- Section A: Basic concepts of chemistry (Dr. Luca Ronconi)
- Section B: Chemical reactions, stoichiometry and chemical reactivity (Prof. Paul Murphy)
- Section C: Bonding and molecular structure (Prof. Paul Murphy)

➤ **Paper-2 ⇒ short-answer questions and problems examination at the end of Semester II**

The written examination of 2 h duration will be marked out of 100 and will be divided into three parts (sections A, B and C). Students are required to answer questions from **all** three sections (each containing an **internal choice** as described in the exam paper).

Questions will be allocated to the three sections as follows:

- Section A: Organic chemistry (Prof. Paul Murphy)
- Section B: Physical chemistry (Dr. David Cheung)
- Section C: Inorganic chemistry (Dr. Luca Ronconi)

Continuous Assessment

- **Attendance** ⇒ mandatory to pre-practical talks and subsequent laboratory sessions
- **Laboratory reports** ⇒ written report of the laboratory work submitted each week through Blackboard

Templates of the laboratory reports are printed in the laboratory manual. Downloadable templates of the laboratory reports (as Word documents) will be available in due course in the "Lab Reports Submission" section on Blackboard.

Attending the laboratory only is **not** enough to get credits: practicals must be completed satisfactorily and completed laboratory reports must be submitted weekly through Blackboard by the relevant deadline (see table below).

Day of the Practical	Submission deadline
Monday	the following Saturday by 5pm
Tuesday	the following Sunday by 5pm
Wednesday	the following Monday by 5pm
Thursday	the following Tuesday by 5pm
Friday	the following Wednesday by 5pm

Each report will be marked out of 10. A "zero" will be assigned for late or no submission.

- **Online homework** ⇒ weekly assignments to be worked out online over the two semesters

A total of 18 online homework (each marked out of 10) will be assigned on a weekly basis and will need to be completed and submitted through Blackboard by the relevant deadline (to be announced in due course).

- **Examination on laboratory work** ⇒ MCQ examination at the end of Semester II

The written examination of 30 min duration will be marked out of 10 and will comprise of 20 MCQs related to the laboratory work carried out in Practicals 1-15 (**not** Practical 16). Students are required to answer **all** MCQs.

It will take place at the end of Semester II during the normal laboratory session in the laboratory, immediately following the pre-practical talk on the day of the last practical (that is, Practical 16).
